# Annex 8, Amendment 106

#### Report on entire Annex

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 1 Reference	INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES	CV CAR 1.F a)	No Difference		
Definition	PART I. DEFINITIONS				
	When the following terms are used in the Standards for the Airworthiness of Aircraft, they have the following meanings:  **Aeroplane.** A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.				
Chapter 1 Reference Definition	Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.	CV CAR 1.F a)	No Difference		
Chapter 1 Reference	<b>Airworthy.</b> The status of an aircraft, engine, propeller or part when it conforms to its approved design and is in a condition for safe operation.	CV-CAR 5.A.115 (4)	No Difference		
Definition					

7/1/2019 Page 1 of 396

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 1 Reference  Definition	Anticipated operating conditions. Those conditions which are known from experience or which can be reasonably envisaged to occur during the operational life of the aircraft taking into account the operations for which the aircraft is made eligible, the conditions so considered being relative to the meteorological state of the atmosphere, to the configuration of terrain, to the functioning of the aircraft, to the efficiency of personnel and to all the factors affecting safety in flight. Anticipated operating conditions do not include:  a) those extremes which can be effectively avoided by means of operating procedures; and  b) those extremes which occur so infrequently that to require the Standards to be met in such extremes would give a higher level of airworthiness than		Less protective or partially implemented or not implemented	Not implemented in Cabo Verde Regulations (CV CAR's).	
Chapter 1 Reference	experience has shown to be necessary and practical.  Appropriate airworthiness requirements. The comprehensive and detailed airworthiness codes established, adopted or	CV CAR 5.A.115 (29)	No Difference		
Definition	accepted by a Contracting State for the class of aircraft, engine or propeller under consideration.				
Chapter 1 Reference Definition	Approved. Accepted by a Contracting State as suitable for a particular purpose.	CV CAR 1.F a)	No Difference

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 1 Reference  Definition	Category A. With respect to helicopters, means a multi-engine helicopter designed with engine and system isolation features specified in Part IVB of Annex 8 and capable of operations using take-off and landing data scheduled under a critical engine failure concept which assures adequate designated surface area and adequate performance capability for continued safe flight or safe rejected take-off.		Less protective or partially implemented or not implemented	Not implemented in CV CAR's.	
Chapter 1 Reference Definition	Category B. With respect to helicopters, means a single-engine or multi-engine helicopter which does not meet Category A standards. Category B helicopters have no guaranteed capability to continue safe flight in the event of an engine failure, and a forced landing is assumed.		Less protective or partially implemented or not implemented	Not implemented in CV CAR's.	
Chapter 1 Reference Definition	Configuration (as applied to the aeroplane). A particular combination of the positions of the moveable elements, such as wing flaps and landing gear, etc., that affect the aerodynamic characteristics of the aeroplane.	CV CAR1.F a)	No Difference		
Chapter 1 Reference  Definition	Continuing airworthiness. The set of processes by which an aircraft, engine, propeller or part complies with the applicable airworthiness requirements and remains in a condition for safe operation throughout its operating life.	CV CAR 5.A.115 (3)	No Difference

Chapter 1 Reference 1.1 Standard	PART II. PROCEDURES FOR CERTIFICATION AND CONTINUING AIRWORTHINESS  Note.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13, that the State of Registry may be unable to fulfil its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of the Operator in such instances until such time as Article 83 bis of the Convention enters into force. Accordingly, the Council urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It was understood that pending entry into force of Article 83 bis of the Convention, the foregoing action would only be a matter of practical convenience and would not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State. However, as Article 83 bis entered into force on 20 June 1997, such transfer agreements will have effect in respect of those Contracting States which have ratified the related Protocol (Doc 9318) upon fulfilment of the conditions established in Article 83 bis.	CV CAR 5.B.100	No Difference

	CHAPTER 1. TYPE CERTIFICATION				
	The Standards of this chapter shall be applicable to all aircraft, and to engines and propellers if type certificated separately, for which the application for certification was submitted to a Contracting State on or after 13 June 1960, except that:  a) the provisions of 1.4 of this part shall only be applicable to an aircraft type for which an application for a Type Certificate was submitted to the State of Design on or after 2 March 2004;  b) the provisions of 1.4 of this part shall only be applicable to an engine or propeller type for which an application for a Type Certificate was submitted to the State of Design on or after 10 November 2016;  c) the provisions of 1.2.6 of this part shall only be applicable to an aircraft type for which an application for a Type Certificate was submitted to the State of Design on or after 31 December 2014; and  d) the provisions of 1.2.7 of this part shall only be applicable to an aircraft type for which an application for a Type Certificate is submitted to the State of Design on or after 28 November 2024.  Note 1.— Normally, a request for a Type Certificate is submitted by the manufacturer when the aircraft, engine or propeller is intended for serial production.

Chapter 1	1.6 Revocation of Type Certificate		Not Applicable		
Reference	\$P		rotrippiicuoic		
1.6.1	1.6.1 The State of Design shall establish procedures for the revocation of a Type Certificate when the organization responsible for the type design surrenders or abandons the				
Standard	Type Certificate, or ceases to exist, and as a result the continuing airworthiness responsibilities established under Chapter 4 of this part can no longer be fulfilled for the affected aircraft type in service. The procedures, at a minimum, shall include:  a) notification to all Contracting States of an intent to revoke a Type Certificate and the proposed termination of the production approval under 2.4 of this part; and  b) consultation with States of Registry for the collection, identification and establishment of supplemental airworthiness requirements considered necessary for the continued airworthiness of the candidate orphan aircraft type.				
Chapter 1 Reference 1.6.2 Standard	1.6.2 Except for reasons concerning the immediate safety of an aircraft type, the State of Design shall not unduly revoke a Type Certificate without providing ample notice and guidance to States of Registry that will be assuming ultimate responsibility for the continued airworthiness of orphaned aircraft on their civil register.		Not Applicable

Annex 8, Amendment 106	

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 3 Reference 3.1	CHAPTER 3. CERTIFICATE OF AIRWORTHINESS	CV CAR 5.B.205	No Difference		
Standard	Note.— The Certificate of Airworthiness as used in these Standards is the Certificate of Airworthiness referred to in Article 31 of the Convention.				
	3.1 Applicability  The Standards of this chapter are applicable in respect of all aircraft, except 3.3 and 3.4 which are not applicable in respect of all aircraft that are of a type of which the prototype was submitted to appropriate national authorities for certification before 13 June 1960.				
Chapter 3 Reference 3.2.1 Standard	3.2 Eligibility, issuance and continued validity of a Certificate of Airworthiness  3.2.1 A Certificate of Airworthiness shall be issued by a Contracting State on the basis of satisfactory evidence that the aircraft complies with the design aspects of the appropriate airworthiness requirements.	CV CAR 5.B.225 a)	No Difference		

	Report on entire Annex

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference	
Chapter 2	2.3.1 Controllability		Not Applicable			
Reference						
2.3.1	The aeroplane shall be controllable and manoeuvrable under all anticipated operating conditions, and it shall be possible to make smooth transitions from one flight condition to another (e.g. turns, sideslips, changes of engine power, changes of					
Standard	aeroplane configurations) without requiring exceptional skill, alertness or strength on the part of the pilot even in the event of failure of any engine. A technique for safely controlling the aeroplane shall be established for all stages of flight and aeroplane configurations for which performance is scheduled.  Note.— This Standard is intended, among other things, to relate to operation in conditions of no appreciable atmospheric turbulence and also to ensure that there is no undue deterioration of the flying qualities in turbulent air.					
Chapter 2	2.3.1.1 Controllability on the ground (or water). The		Not Applicable			
Reference	aeroplane shall be controllable on the ground (or on the water)		roorippiiouoio			
2.3.1.1	during taxiing, take-off and landing under the anticipated operating conditions.					
Standard						
Chapter 2	2.3.1.2 Controllability during take-off. The aeroplane		Not Applicable			
Reference	shall be controllable in the event of sudden failure of the					
2.3.1.2	critical engine at any point in the take-off, when the aeroplane is handled in the manner associated with the scheduling of take-off paths and accelerate-stop distances.					
Standard

	Report on entire Annex					
Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference	
Chapter 2 Reference 2.3.1.3 Standard	2.3.1.3 Take-off safety speed. The take-off safety speeds assumed when the performance of the aeroplane (after leaving the ground or water) during the take-off is determined shall provide an adequate margin above the stall and above the minimum speed at which the aeroplane remains controllable after sudden failure of the critical engine.		Not Applicable			
Chapter 2 Reference 2.3.2 Standard	The aeroplane shall have such trim and other characteristics as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. This shall apply both in normal operation and in the conditions associated with the failure of one or more engines for which performance characteristics are established.		Not Applicable			
Chapter 2 Reference 2.3.3 Standard	The aeroplane shall have such stability in relation to its other flight characteristics, performance, structural strength and most probable operating conditions (e.g. aeroplane configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the aeroplane shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the aeroplane is prejudiced by lack of manoeuvrability in emergency conditions.		Not Applicable

3.2 Airspeeds		Not Applicable		
3.2.1 Design airspeeds				
Design airspeeds shall be established for which the aeroplane structure is designed to withstand the corresponding manoeuvring and gust loads in accordance with 3.3. In establishing the design airspeeds, consideration shall be given to the following speeds:				
a) VA, the design manoeuvring speed;				
b) VB, the speed at which the maximum vertical gust velocity assumed in accordance with 3.3.2 can be withstood;				
c) VC, a speed not expected to be exceeded in normal cruising flight taking into account possible effects of upsets when flying in turbulent conditions;				
d) VD, maximum dive speed, sufficiently greater than the speed in c), to make it unlikely that such a design speed would be exceeded as a result of inadvertent speed increases in the anticipated operating conditions, taking into account the flying qualities and other characteristics of the aeroplane;				
e) VE1 to VEn, maximum speeds at which flaps and landing gears may be extended or other configuration changes be made.				
The speeds VA, VB, VC, and VE in a), b), c) and e) shall be sufficiently greater than the stalling speed of the aeroplane to safeguard against loss of control in turbulent air.				
	3.2 Airspeeds  3.2.1 Design airspeeds  Design airspeeds shall be established for which the aeroplane structure is designed to withstand the corresponding manoeuvring and gust loads in accordance with 3.3. In establishing the design airspeeds, consideration shall be given to the following speeds:  a) VA, the design manoeuvring speed;  b) VB, the speed at which the maximum vertical gust velocity assumed in accordance with 3.3.2 can be withstood;  c) VC, a speed not expected to be exceeded in normal cruising flight taking into account possible effects of upsets when flying in turbulent conditions;  d) VD, maximum dive speed, sufficiently greater than the speed in c), to make it unlikely that such a design speed would be exceeded as a result of inadvertent speed increases in the anticipated operating conditions, taking into account the flying qualities and other characteristics of the aeroplane;  e) VE1 to VEn, maximum speeds at which flaps and landing gears may be extended or other configuration changes be made. 	possibility of incorrect or restricted operation of the controls by the crew, due to fatigue, confusion or interference. Consideration shall be given at least to the following: layout and identification of controls and instruments, rapid identification of emergency situations, sense of controls, ventilation, heating and noise.				
	d) Pilot vision. The arrangement of the pilot compartment shall be such as to afford a sufficiently extensive, clear and undistorted field of vision for the safe operation of the aeroplane, and to prevent glare and reflections that would interfere with the pilot's vision. The design features of the pilot windshield shall permit, under precipitation conditions, sufficient vision for the normal conduct of flight and for the execution of approaches and landings.				
	e) Provision for emergencies. Means shall be provided which shall either automatically prevent, or enable the flight crew to deal with, emergencies resulting from foreseeable failures of equipment and systems, the failure of which would endanger the aeroplane. Reasonable provisions shall be made for continuation of essential services following engine or system failures to the extent that such failures are catered for in the performance and operating limitations specified in the Standards in this Annex and in Annex 6, Parts I and II.				
	f) Fire precautions. The design of the aeroplane and the materials used in its manufacture, including cabin interior furnishing materials replaced during major refurbishing, shall be such as to minimize the possibility of in-flight and ground fires and also to minimize the production of smoke and toxic gases in the event of a fire. Means shall be provided to

Chapter 1 Reference 1.1.1	PART IIIB. AEROPLANES OVER 5 700 KG FOR WHICH APPLICATION FOR CERTIFICATION WAS SUBMITTED ON OR AFTER 2 MARCH 2004		Not Applicable		
Standard	CHAPTER 1. GENERAL				
	1.1 Applicability  1.1.1 The Standards of this part are applicable in respect of all aeroplanes designated in 1.1.2 for which an application for the issue of a Type Certificate was submitted to the appropriate national authorities on or after 2 March 2004.				
Chapter 1 Reference 1.1.2 Standard	1.1.2 Except for those Standards and Recommended Practices which specify a different applicability, the Standards and Recommended Practices of this part shall apply to all aeroplanes with a maximum certificated take-off mass greater than 5 700 kg and intended for the carriage of passengers or cargo or mail in international air navigation.  Note 1.— The aeroplanes described in 1.1.2 are known in some States as transport category aeroplanes.		Not Applicable		
	Note 2.— The following Standards do not include quantitative specifications comparable to those found in national airworthiness codes. In accordance with 1.2.1 of Part II, these Standards are to be supplemented by requirements established, adopted or accepted by Contracting States.

### Report on entire Annex

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 2 Reference 2.3.2.1 Standard	2.3.2 Controllability  2.3.2.1 The aeroplane shall be controllable and manoeuvrable under all anticipated operating conditions, and it shall be possible to make smooth transitions from one flight condition to another (e.g. turns, sideslips, changes of engine power or thrust, changes of aeroplane configurations) without requiring exceptional skill, alertness or strength on the part of the pilot even in the event of failure of any engine. A technique for safely controlling the aeroplane shall be established for all stages of flight and aeroplane configurations for which performance is scheduled.  Note.— This Standard is intended, among other things, to relate to operation in conditions of no appreciable atmospheric turbulence and also to ensure that there is no undue deterioration of the flying qualities in turbulent air.		Not Applicable		
Chapter 2 Reference 2.3.2.2 Standard	2.3.2.2 Controllability on the ground (or water). The aeroplane shall be controllable on the ground (or on the water) during taxiing, take-off and landing under the anticipated operating conditions.		Not Applicable		
Chapter 2 Reference 2.3.2.3 Standard	2.3.2.3 Controllability during take-off. The aeroplane shall be controllable in the event of sudden failure of the critical engine at any point in the take-off, when the aeroplane is handled in the manner associated with the scheduling of take-off paths and accelerate-stop distances.		Not Applicable

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 2 Reference 2.3.2.4 Standard	2.3.2.4 Take-off safety speed. The take-off safety speeds assumed when the performance of the aeroplane (after leaving the ground or water) during the take-off is determined shall provide an adequate margin above the stall and above the minimum speed at which the aeroplane remains controllable after sudden failure of the critical engine.		Not Applicable		
Chapter 2 Reference 2.3.3 Standard	2.3.3 Trim  The aeroplane shall have such trim characteristics as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. This shall apply both in normal operation and in the conditions associated with the failure of one or more engines for which performance characteristics are established.		Not Applicable

Chapter 2	2.4 Stability and control		Not Applicable		
Reference	· · · · · · · · · · · · · · · · · · ·		rotrippiicuoic		
2.4.1	2.4.1 Stability				
Standard	The aeroplane shall have such stability in relation to its other flight characteristics, performance, structural strength and most probable operating conditions (e.g. aeroplane configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the aeroplane shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the aeroplane is prejudiced by lack of manoeuvrability in emergency conditions. It shall be shown that any combination of failures or conditions that would result in the need for exceptional piloting skills is extremely improbable. The stability may be achieved by natural or artificial means, or a combination of both. If compliance with the flight characteristics requirements is dependent upon a stability augmentation system or upon any other automatic or power-operated system, compliance shall be shown with 4.2 of this part.

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 2 Reference 2.4.2.1 Standard	2.4.2 Stalling  2.4.2.1 Stall warning. Until 7 March 2021, when the aeroplane approaches a stall both in straight and turning flight with all engines operating, a clear and distinctive stall warning shall be apparent to the pilot with the aeroplane in all permissible configurations and powers or thrusts, except those which are not considered to be essential for safe flying. The stall warning and other characteristics of the aeroplane shall be such as to enable the pilot to arrest the development of the stall after the warning begins and, without altering the engine power or thrust, to maintain full control of the aeroplane.		Not Applicable		
Chapter 2 Reference 2.4.2.1 Standard	2.4.2.1 Stall warning. As of 7 March 2021, when the aeroplane approaches a stall both in straight and turning flight, a clear and distinctive stall warning shall be apparent to the pilot with the aeroplane in all permissible configurations and powers or thrusts, except those which are not considered to be essential for safe flying. The stall warning and other characteristics of the aeroplane shall be such as to enable the pilot to arrest the development of the stall after the warning begins and, without altering the engine power or thrust, to maintain full control of the aeroplane.		Not Applicable		
Chapter 2 Reference 2.4.2.2 Standard	2.4.2.2 Behaviour following a stall. In any configuration and at any level of power or thrust in which it is considered that the ability to recover from a stall is essential, the behaviour of the aeroplane following a stall shall not be so extreme as to make difficult a prompt recovery without exceeding the airspeed or strength limitations of the aeroplane.		Not Applicable

Chapter 4	4.1.6 Inspection provisions		Not Applicable		
Reference					
4.1.6	Adequate provision shall be made to permit any necessary examination, replacement or reconditioning of parts of the aeroplane that require such attention, either periodically or				
Standard	after unusually severe operations.				

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 4	4.2 Systems design features		Not Applicable		
Reference 4.2	Special consideration shall be given to design features that affect the ability of the flight crew to maintain controlled flight. This shall include at least the following:				
Standard	a) Controls and control systems. The design of the controls and control systems shall be such that:				
	<ol> <li>each control and control system shall operate with the ease, smoothness and precision appropriate to its function;</li> </ol>				
	<ol><li>continued safe flight and landing of the aeroplane shall not be prevented by:</li></ol>				
	i) any single failure not shown to be extremely improbable in the control system; or				
	ii) any event that results in a jam of a flight control in any normally encountered position of the flight controls;				
	<ol> <li>the possibility of jamming, inadvertent operation and unintentional engagement of control surface locking devices is minimized; and</li> </ol>				
	4) each element of each flight control system is designed, or distinctively and permanently marked, to minimize the probability of any incorrect assembly that could result in the malfunction of the system.				
	<ul> <li>b) System survivability.</li> <li>1) For aeroplanes of a maximum certificated take-off mass in excess of 45 500 kg or with a passenger</li> </ul>				

7/1/2019 Page 143 of 396

	Report on entire Annex				
Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
	seating capacity greater than 60, aeroplane systems shall be designed, arranged and physically separated to maximize the potential for continued safe flight and landing after any event resulting in damage to the aeroplane structure or systems.				
	2) Recommendation.— For aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg but not exceeding 45 500 kg, aeroplane systems should be designed, arranged and physically separated to maximize the potential for continued safe flight and landing after any event resulting in damage to the aeroplane structure or systems.				
	c) Crew environment. The design of the flight crew compartment shall be such as to minimize the possibility of incorrect or restricted operation of the controls by the crew, due to fatigue, confusion or interference. Consideration shall be given at least to the following: layout and identification of controls and instruments, rapid identification of emergency situations, sense of controls, ventilation, heating and noise.				
	d) <i>Pilot vision</i> . The arrangement of the flight crew compartment shall be such as to afford a sufficiently extensive, clear and undistorted field of vision for the safe operation of the aeroplane, and to prevent glare and reflections that would interfere with the pilot's vision. The design features of the windshield shall permit, under precipitation conditions, sufficient vision for the normal conduct of flight and for the execution of approaches and landings.				
	e) Provision for emergencies. Means shall be provided				

7/1/2019 Page 144 of 396

	<u></u>	eport on entire Annex			**************************************
Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
	which shall either automatically prevent, or enable the flight crew to deal with, emergencies resulting from foreseeable failures of equipment and systems, the failure of which would endanger the aeroplane. Reasonable provisions shall be made for continuation of essential services following engine or system failures to the extent that such failures are catered for in the performance and operating limitations specified in the Standards in this Annex and in Annex 6, Parts I and II.  f) Fire precautions.  1) The design of the aeroplane and the materials used in its manufacture shall be such so as to minimize the risk of in-flight and ground fires, to minimize the production of smoke and toxic gases in the event of a fire and to delay the occurrence of flashover resulting from heat release in the cabin. Means shall be provided to contain or to detect and extinguish such fires as might occur in such a way that no additional danger to the aeroplane is caused. Lavatories installed in aeroplanes shall be equipped with a smoke detection system and a built-in fire extinguisher system for each receptacle intended for the disposal of towels, paper or waste.  2) For aeroplanes for which application for certification was submitted on or after 24 February 2013, design precautions shall be taken to minimize the risk of an uncontained fire initiating in areas of the aeroplane that contain high concentrations of wiring or equipment that are not normally accessible in flight.  Note.— Design precautions may include the

Chapter 9	CHAPTER 9. OPERATING ENVIRONMENT		Not Applicable			
Reference	AND HUMAN FACTORS					
9.1						
Standard	9.1 General					
	The aeroplane shall be designed to allow safe operation within					
	the performance limitations of its passengers and those who					
	operate, maintain and service it.					
	Note.— The human/machine interface is often the weak					
	link in an operating environment; so, it is necessary to					
	ensure that the aeroplane is capable of being controlled at					
	all phases of the flight (including any degradation due to failures) and that neither the crew nor passengers are					
	harmed by the environment in which they have been placed					
	for the duration of the flight.					
Chapter 9	9.2 Flight crew		Not Applicable			
Reference						
9.2.1	9.2.1 The aeroplane shall be designed in such a way as to allow safe and efficient control by the flight crew. The					
	design shall allow for variations in flight crew skill and					
Standard	physiology commensurate with flight crew licensing limits.					
	Account shall be taken of the different expected operating conditions of the aeroplane in its environment, including					
	operations degraded by failures.

	Report on Charte Annex				
Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 2	2.3 Flying qualities		Not Applicable		
Reference					
2.3	The helicopter shall comply with the Standards of 2.3 at all altitudes up to the maximum anticipated altitude relevant to the				
Standard	particular requirement in all temperature conditions relevant to the altitude in question and for which the helicopter is approved.				
Chapter 2	2.3.1 Controllability		Not Applicable		
Reference			rotrippiicuoic		
2.3.1	The helicopter shall be controllable and manoeuvrable under				
	all anticipated operating conditions, and it shall be possible to				
Standard	make smooth transitions from one flight condition to another (e.g. turns, sideslips, changes of engine power, changes of				
Stalldard	helicopter configurations) without requiring exceptional skill,				
	alertness or strength on the part of the pilot even in the event				
	of failure of any engine. A technique for safely controlling the				
	helicopter shall be established for all stages of flight and helicopter configurations for which performance is scheduled.				
	Note.— This Standard is intended, among other things,				
	to relate to operation in conditions of no appreciable				
	atmospheric turbulence and also to ensure that there is no undue deterioration of the flying qualities in turbulent air.				
Chapter 2	2.3.1.1 Controllability on the ground (or water). The		Not Applicable		
Reference	helicopter shall be controllable on the ground (or on the water)		Тостррисцою		
2.3.1.1	during taxiing, take-off and landing under the anticipated operating conditions.				
Standard

Chapter 2 Reference 2.3.1.2 Standard	2.3.1.2 Controllability during take-off. The helicopter shall be controllable in the event of sudden failure of the critical engine at any point in the take-off, when the helicopter is handled in the manner associated with the scheduling of the take-off data.		Not Applicable		
Chapter 2					
Reference	2.3.2 Trim		Not Applicable		
2.3.2 Standard	The helicopter shall have such trim and handling capabilities as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. In the event of a malfunction of the systems associated with the flight controls, there shall not be any significant deterioration of the handling characteristics.				
Chapter 2	2.3.3 Stability		Not Applicable		
Reference					
2.3.3 Standard	The helicopter shall have such stability in relation to its other flight characteristics, performance, structural strength and most probable operating conditions (e.g. helicopter configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive				
	when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the helicopter shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the helicopter is prejudiced by lack of manoeuvrability in emergency conditions.

Chapter 4	4.1.6 Systems design feetures		N. 4 1: 11		
Reference	4.1.6 Systems design features		Not Applicable		
4.1.6	Special consideration shall be given to design features that affect the ability of the flight crew to maintain controlled flight. This shall include at least the following:				
Standard	a) Controls and control systems. The design of the controls and control systems shall be such as to minimize the possibility of jamming, inadvertent operation and unintentional engagement of control surface locking devices.  i) Each control and control system shall operate with the ease, smoothness and effectiveness appropriate to its function.  ii) Each element of each flight control system shall be designed to minimize the probability of any incorrect assembly that could result in the malfunction of the system.				
	<ul> <li>b) Crew environment. The design of the flight crew compartment shall be such as to minimize the possibility of incorrect or restricted operation of the controls by the crew, due to fatigue, confusion or interference. Consideration shall be given at least to the following: layout and identification of controls and instruments, rapid identification of emergency situations, sense of controls, ventilation, heating and noise.</li> <li>c) Pilot vision. The arrangement of the pilot compartment shall be such as to afford a sufficiently extensive, clear and undistorted field of vision for the safe operation of the helicopter, and to prevent glare and reflections that would interfere with the pilot's vision. The design features of the pilot windshield</li> </ul>

	shall permit, under precipitation conditions, sufficient vision for the normal conduct of flight and for the execution of approaches and landings.	1			
	d) Provision for emergencies. Means shall be provided which shall either automatically prevent, or enable the flight crew to deal with, emergencies resulting from foreseeable failures of equipment and systems, the failure of which would endanger the helicopter. Reasonable provisions shall be made for continuation of essential services following engine or system failures to the extent that such failures are catered for in the performance and operating limitations specified in the Standards in this Annex and in Annex 6, Part III.				
	e) Fire precautions. The design of the helicopter and the materials used in its manufacture, including cabin interior furnishing materials replaced during major refurbishing, shall be such as to minimize the possibility of in-flight and ground fires and also to minimize the production of smoke and toxic gases in the event of a fire. Means shall be provided to contain or to detect and extinguish, wherever possible, all accessible fires as might occur in such a way that no additional danger to the helicopter is caused.				
	f) Incapacitation of occupants. Design precautions shall be taken to protect against possible instances of cabin depressurization and against the presence of smoke or other toxic gases that could incapacitate the occupants of the helicopter.

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 6	6.8.2 Rotor and power transmission systems vibration		Not Applicable		
Reference	1		roorippiiouoio		
6.8.2	The vibration stresses for the rotor and power transmission systems shall be determined and shall not exceed values that have been found safe for operation within the operating				
Standard	limitations established for the helicopter.				
Chapter 6	6.8.3 Cooling		Not Applicable		
Reference			Tr		
6.8.3	The cooling system shall be capable of maintaining powerplant and power transmission systems temperatures within the established limits (see 6.5) at ambient air				
Standard	temperatures approved for operation of the helicopter. The maximum and minimum air temperatures for which the powerplant and power transmission systems have been established as being suitable shall be scheduled in the helicopter flight manual.				
Chapter 6	6.8.4 Associated systems		Not Applicable		
Reference					
6.8.4	The fuel, oil, air induction and other systems associated with each engine, each power transmission unit and each rotor shall be capable of supplying the appropriate unit in				
Standard	accordance with its established requirements, under all conditions affecting the functioning of the systems (e.g. engine power setting, helicopter attitudes and accelerations, atmospheric conditions, fluid temperatures) within the anticipated operating conditions.

Chapter 6	6.8.5 Fire protection		Not Applicable		
Reference	0.0.5 The protection		Not Applicable		
6.8.5	For designated fire zones where the potential fire hazards are particularly serious because of the proximity of ignition sources to combustible materials, the following shall apply in				
Standard	addition to the general Standard of 4.1.6 e):				
	a) Isolation. Such zones shall be isolated by fire-resisting material from other zones of the helicopter where the presence of fire would jeopardize continued flight, taking into account the probable points of origin and paths of propagation of fire.				
	b) Flammable fluids. Flammable fluid system components located in such zones shall be capable of containing the fluid when exposed to fire conditions. Means shall be provided for the crew to shut off the flow of hazardous quantities of flammable fluids into such zones if a fire occurs.				
	c) Fire detection. There shall be provided a sufficient number of fire detectors so located as to ensure rapid detection of any fire that might occur in such zones.				
	d) Fire extinguishment. Such zones shall be provided with a fire extinguisher system capable of extinguishing any fire likely to occur therein, unless the degree of isolation, quantity of combustibles, fire resistance of the structure and other factors are such that any fire likely to occur in the zone would not jeopardize the safety of the helicopter.

Chapter 7	7.3 Safety and survival equipment		Not Applicable		
Reference					
7.3	Prescribed safety and survival equipment that the crew or passengers are expected to use or operate at the time of an emergency shall be reliable, readily accessible and easily				
Standard	identified, and its method of operation shall be plainly marked.				
Chapter 7					
Reference	7.4 Navigation lights and anti-collision lights		Not Applicable		
7.4.1	7.4.1 The lights required by Annex 2 — <i>Rules of the Air</i> to be displayed by helicopters in flight or operating on the movement area of an aerodrome or a heliport shall have				
Standard	intensities, colours, fields of coverage and other characteristics such that they furnish the pilot of another aircraft or personnel on the ground with as much time as possible for interpretation and for subsequent manoeuvre necessary to avoid a collision. In the design of such lights, due account shall be taken of the conditions under which they may reasonably be expected to perform these functions.				
	Note 1.— It is likely that lights will be viewed against a variety of backgrounds, such as typical city lighting, clear starry sky, moonlit water and daytime conditions of low background luminance. Furthermore, collision risk situations are most likely to arise in terminal control areas in which aircraft are manoeuvring in the intermediate and lower flight levels at closing speeds that are unlikely to exceed 900 km/h (500 kt).				
	Note 2.— Detailed technical specifications for exterior lights for helicopters can be found in the Airworthiness Manual (Doc 9760).

Chapter 2					
Chapter 2	2.2.7 Scheduling of performance		Not Applicable		
Reference					
2.2.7	Performance data shall be determined and scheduled in the flight manual as follows for the ranges of mass, altitude, temperature and other operational variables for which the				
Standard	helicopter is to be certificated, and additionally for amphibians, water surface conditions and strength of current shall be included.				
	a) Hover performance. The hover performance shall be determined for both in-ground effect and out-of-ground effect with all engines operating.				
	b) <i>Climb</i> . The steady rate of climb with the engine(s) operating at or within approved limits shall be established.				
	c) Height-velocity envelope. If there are any combinations of height and forward velocity (including hover) under which a safe landing cannot be made after failure of the critical engine and with the remaining engine(s) (if applicable) operating within approved limits, a height-velocity envelope shall be established.				
	d) Take-off distance — all engines operating. Where required by the operating rules, the take-off distance — all engines operating shall be the horizontal distance required from the start of the take-off to the point where a selected speed up to the best rate of climb speed (Vy) and selected height above the take-off surface are achieved, all engines operating at approved take-off power required.				
	In addition, for Category A helicopters:				
	e) Minimum performance. The minimum climb

Reference	where the potential fire hazards are particularly serious		Tr		
5.2.8.6	because of the proximity of ignition sources to combustible materials, the following shall apply in addition to the general Standard of 4.2 e).				
Standard	a) <i>Isolation</i> . Such regions shall be isolated by fire				
	resistant material from other regions of the helicopter where the presence of fire would jeopardize continued flight and landing (helicopters of a maximum certificated take-off mass greater than 3 175 kg or Category A) or would jeopardize safe landing (other helicopters), taking into account the probable points of origin and paths of propagation of fire.				
	b) Flammable fluids. Flammable fluid system components located in such regions shall be fire resistant. Drainage of each region shall be provided to minimize hazards resulting from the failure of any component containing flammable fluids. Means shall be provided for the crew to shut off the flow of flammable fluids into such regions if a fire occurs. Where sources of flammable fluid exist in such regions, the whole of the related system within the region, including supporting structure, shall be fireproof or shielded from the effects of fires.				
	c) Fire detection. For turbine engine installations, a sufficient number of fire detectors shall be provided and located to ensure rapid detection of any fire that might occur in such regions, unless the fire can be readily observed in flight by the pilot in the cockpit.				
	d) Fire extinguishment. For turbine engine helicopters of a maximum certificated take-off mass greater than 3 175 kg, such regions shall be provided with a fire extinguisher system capable of extinguishing any fire

Chapter 6	6.4 Navigation lights and anti-collision lights		Not Applicable		
Reference			''		
6.4.1	6.4.1 The lights required by Annex 2 — <i>Rules of the Air</i> to be displayed by helicopters in flight or operating on the movement area of an aerodrome or a heliport shall have				
Standard	intensities, colours, fields of coverage and other characteristics such that they furnish the pilot of another aircraft or personnel on the ground with as much time as possible for interpretation and for subsequent manoeuvre necessary to avoid a collision. In the design of such lights, due account shall be taken of the conditions under which they may reasonably be expected to perform these functions.  Note.— It is likely that lights will be viewed against a variety of backgrounds, such as typical city lighting, clear starry sky, moonlit water and daytime conditions of low background luminance. Furthermore, collision risk situations are most likely to arise in terminal control areas in which aircraft are manoeuvring in the intermediate and lower flight levels at closing speeds that are unlikely to exceed 900 km/h (500 kt).				
Chapter 6 Reference 6.4.2	6.4.2 Lights shall be installed in helicopters so as to minimize the possibility that they will adversely affect the satisfactory performance of the flight crews' duties.		Not Applicable		
Standard	Note.— In order to avoid the effects mentioned in 6.4.2, it will be necessary in some cases to provide means whereby the pilot can adjust the intensity of the flashing lights.

Chapter 9 Reference 9.1	CHAPTER 9. OPERATING ENVIRONMENT AND HUMAN FACTORS		Not Applicable		
Standard	9.1 General  The helicopter shall be designed to allow safe operation within the performance limitations of its passengers and those who operate, maintain and service it.  Note.— The human/machine interface is often the weak link in an operating environment; so, it is necessary to ensure that the helicopter is capable of being controlled at all phases of the flight (including any degradation due to failures) and that neither the crew nor passengers are harmed by the environment in which they have been placed for the duration of the flight.				
Chapter 9 Reference 9.2.1 Standard	9.2.1 The helicopter shall be designed in such a way as to allow safe and efficient control by the flight crew. The design shall allow for variations in flight crew skill and physiology commensurate with flight crew licensing limits. Account shall be taken of the different expected operating conditions of the helicopter in its environment, including operations degraded by failures.		Not Applicable

Chapter 2	2.2.7 Scheduling of performance		Not Applicable		
Chapter 2 Reference 2.2.7 Standard	Performance data shall be determined and scheduled in the flight manual in order to provide a safe relationship between the performance of the aeroplane and the aerodromes and routes on which it is capable of being operated. Performance data shall be determined and scheduled for the following stages for the ranges of mass, altitude or pressure-altitude, wind velocity, gradient of the take-off and landing surface for landplanes; water surface conditions, density of water and strength of current for seaplanes; and for any other operational variables for which the aeroplane is to be certificated.  a) Take-off. The take-off performance data shall include the distance required to take-off and climb to a selected height above the take-off surface. It shall be determined for each mass, altitude and temperature within the operational limits established for take-off with:  — take-off power on each engine; — wing flaps in the take-off position(s); and — landing gear extended.  b) En route. For aeroplanes with more than one engine, the en-route climb performance shall be the climb (or descent) performance with the aeroplane in the en-route configuration with the critical engine inoperative. The operating engine(s) shall not exceed maximum continuous power or thrust.  c) Landing. The landing distance shall be the horizontal		Not Applicable		
	distance traversed by the aeroplane from a point on the approach flight path at a selected height above the landing surface to the point on the landing				

7/1/2019 Page 286 of 396

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 2 Reference 2.3.2.4 Standard	2.3.2.4 Take-off safety speed. The take-off safety speeds assumed when the performance of the aeroplane (after leaving the ground or water) during the take-off is determined shall provide an adequate margin above the stall and above the minimum speed at which the aeroplane remains controllable after sudden failure of the critical engine.		Not Applicable		
Chapter 2 Reference 2.3.3 Standard	2.3.3 Trim  The aeroplane shall have such trim characteristics as to ensure that the demands made on the pilot's attention and ability to maintain a desired flight condition are not excessive when account is taken of the stage of flight at which these demands occur and their duration. This shall apply both in normal operation and in the conditions associated with the failure of one or more engines for which performance characteristics are established.		Not Applicable

Chapter 2 Reference 2.4.1	2.4 Stability and control  2.4.1 Stability		Not Applicable		
Standard	The aeroplane shall have such stability in relation to its other flight characteristics, performance, structural strength and most probable operating conditions (e.g. aeroplane configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the aeroplane shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the aeroplane is prejudiced by lack of manoeuvrability in emergency conditions. The stability may be achieved by natural or artificial means, or a combination of both. In those cases where artificial stability is necessary to show compliance with the Standards of this part, it shall be shown that any failure or condition that would result in the need for exceptional pilot skill or strength for recovery of aeroplane stability is extremely improbable.

Chapter 3	CHAPTER 3. TESTS		Not Applicable		
Reference			Pr ····		
3					
Standard	The engine type shall complete satisfactorily such tests as are necessary to verify the validity of the declared ratings, conditions and limitations and to ensure that it will operate satisfactorily and reliably. The tests shall include at least the following:				
	a) Power calibration. Tests shall be conducted to establish the power or thrust characteristics of the engine when new and also after the tests in b) and c). There shall be no excessive decrease in power at the conclusion of all the tests specified.				
	b) Operation. Tests shall be conducted to ensure that starting, idling, acceleration, vibration, over-speeding and other characteristics are satisfactory and to demonstrate adequate margins of freedom from detonation, surge, flutter or other detrimental conditions as may be appropriate to the particular type engine.				
	c) Endurance. Tests of sufficient duration shall be conducted at such powers, thrust, speeds, temperatures and other operating conditions as are necessary to demonstrate reliability and durability of the engine. They shall also include operation under conditions in excess of the declared limits to the extent that such limitations might be exceeded in actual service.				
	d) Operating Environment. Tests shall be conducted to ensure that the engine characteristics are satisfactory with regard to the operating environment.

Chapter 2	2.2.4 Minimum performance		Not Applicable		
Reference					
2.2.4	Minimum performance shall be scheduled for aeroplanes with more than one engine that are turbine-powered or have a maximum certificated take-off mass of over 2 721 kg as follows:				
Standard	a) at the maximum masses scheduled (see 2.2.7) for take-off and for landing, as functions of the aerodrome elevation or pressure-altitude either in the standard atmosphere or in specified still air atmospheric conditions; and  b) for seaplanes in specified conditions in smooth water,  the aeroplane shall be capable of accomplishing the minimum performances specified in 2.2.5 a) and 2.2.6 a) respectively, not considering obstacles, or runway or water run length.  Note.— This Standard permits the maximum take-off mass and maximum landing mass to be scheduled in the flight manual against, for example:  — aerodrome elevation, or  — pressure-altitude at aerodrome level, or  — pressure-altitude and atmospheric temperature at aerodrome level,  so as to be readily usable when applying the national code on aeroplane performance operating limitations.

Chapter 2	2.2.7 Scheduling of performance		Not Applicable		
Reference	3 · F · · · · · ·		rotrippiicuoic		
2.2.7	Performance data shall be determined and scheduled in the flight manual in order to provide a safe relationship between the performance of the aeroplane and the aerodromes and				
Standard	routes on which it is capable of being operated. Performance data shall be determined and scheduled for the following stages for the ranges of mass, altitude or pressure-altitude, wind velocity, gradient of the take-off and landing surface for landplanes; water surface conditions, density of water and strength of current for seaplanes; and for any other operational variables for which the aeroplane is to be certificated.				
	a) Take-off. The take-off performance data shall include the distance required to take-off and climb to a selected height above the take-off surface. It shall be determined for each mass, altitude and temperature within the operational limits established for take-off with:				
	<ul> <li>take-off power on each engine;</li> <li>wing flaps in the take-off position(s); and</li> </ul>				
	<ul> <li>— landing gear extended.</li> </ul>				
	b) En route. For aeroplanes with more than one engine, the en-route climb performance shall be the climb (or descent) performance with the aeroplane in the en-route configuration with the critical engine inoperative. The operating engine(s) shall not exceed maximum continuous power or thrust.				
	c) Landing. The landing distance shall be the horizontal distance traversed by the aeroplane from a point on the approach flight path at a selected height above the landing surface to the point on the landing

Chapter 2	2.4 Stability and control		Not Applicable		
Reference					
2.4.1	2.4.1 Stability				
Standard	The aeroplane shall have such stability in relation to its other flight characteristics, performance, structural strength, and most probable operating conditions (e.g. aeroplane configurations and speed ranges) as to ensure that demands made on the pilot's powers of concentration are not excessive when the stage of the flight at which these demands occur and their duration are taken into account. The stability of the aeroplane shall not, however, be such that excessive demands are made on the pilot's strength or that the safety of the aeroplane is prejudiced by lack of manoeuvrability in emergency conditions. The stability may be achieved by natural or artificial means, or a combination of both. In those cases where artificial stability is necessary to show compliance with the Standards of this part, it shall be shown that any failure or condition that would result in the need for exceptional pilot skill or strength for recovery of aeroplane stability is extremely improbable.				
Chapter 2	2.4.2 Stalling		Not Applicable		
Reference			тост гррпопоте		
2.4.2.1	2.4.2.1 <i>Stall warning</i> . When the aeroplane approaches a stall both in straight and turning flight, a clear and distinctive stall warning shall be apparent to the pilot with the aeroplane				
Standard	in all permissible configurations, except those which are not considered to be essential for safe flying. The stall warning and other characteristics of the aeroplane shall be such as to enable the pilot to arrest the development of the stall after the warning begins and, without altering the engine power or thrust, to maintain full control of the aeroplane.

Chapter 6	6.4 Navigation lights and anti-collision lights		Not Applicable		
Reference			''		
6.4.1	6.4.1 The lights required by Annex 2 — <i>Rules of the Air</i> to be displayed by aeroplanes in flight or operating on the movement area of an aerodrome shall have intensities, colours,				
Standard	fields of coverage and other characteristics such that they furnish the pilot of another aircraft or personnel on the ground with as much time as possible for interpretation and for subsequent manoeuvre necessary to avoid a collision. In the design of such lights, due account shall be taken of the conditions under which they may reasonably be expected to perform these functions.  *Note.— It is likely that lights will be viewed against a variety of backgrounds, such as typical city lighting, clear starry sky, moonlit water and daytime conditions of low background luminance. Furthermore, collision risk situations are most likely to arise in terminal control areas in which aircraft are manoeuvring in the intermediate and lower flight levels at closing speeds that are unlikely to exceed 900 km/h (500 kt).				
Chapter 6 Reference 6.4.2	6.4.2 Lights shall be installed in aeroplanes so as to minimize the possibility that they will adversely affect the satisfactory performance of the flight crews' duties.		Not Applicable		
Standard	Note.— In order to avoid the effects mentioned in 6.4.2, it will be necessary in some cases to provide means whereby the pilot can adjust the intensity of the flashing lights.

Chapter 9 Reference 9.2.2 Standard	9.2.2 The workload imposed on the flight crew by the design of the aeroplane shall be reasonable at all stages of flight. Particular consideration shall be given to critical stages of flight and critical events which may reasonably be expected to occur during the service life of the aeroplane, such as a contained engine failure or windshear encounter.  Note.— Workload can be affected by both cognitive and physiological factors.		Not Applicable		
Chapter 9 Reference 9.3	9.3 Ergonomics  During design of the aeroplane, account shall be taken of ergonomic factors including:		Not Applicable		
Standard	<ul> <li>a) ease of use and prevention of inadvertent misuse;</li> <li>b) accessibility;</li> <li>c) flight crew working environment;</li> <li>d) cockpit standardization; and</li> <li>e) maintainability.</li> </ul>

Annex 8, Amendment 106	

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference
Chapter 1 Reference 1.1.1	PART VII. PROPELLERS		Not Applicable		
Standard	CHAPTER 1. GENERAL				
	1.1 Applicability				
	1.1.1 The Standards of this part are applicable to all propellers, as required in Parts IIIB and V. The Standards of this part are applicable to a propeller at the time of submission of an application to the appropriate national authority for a type approval.				
	Note.— The following Standards do not include quantitative specifications comparable to those found in national airworthiness codes. In accordance with 1.2.1 of Part II, these Standards are to be supplemented by requirements established, adopted or accepted by Contracting States.				
Chapter 1 Reference 1.1.2	1.1.2 The level of airworthiness defined by the appropriate parts of the comprehensive and detailed national code for the propellers designated in 1.1.1 shall be at least substantially equivalent to the overall level intended by the broad Standards of this part.		Not Applicable

Chapter 2	2.2 Failure analysis		Not Applicable		
Reference					
2.2 Standard	A safety assessment of the propeller shall be conducted to ensure that it functions safely throughout the full range of operating conditions. A summary shall be made of those failures which could result in hazardous propeller effects. If the primary failure of single elements (for example, blades) is likely to result in hazardous propeller effects, reliance shall be placed on meeting prescribed integrity requirements.				
Chapter 2	2.2 M.4		N		
Reference	2.3 Materials and manufacturing methods		Not Applicable		
2.3 Standard	The selection of materials and the manufacturing methods and processes shall account for the operational environment of the propeller expected in service. The materials and manufacturing methods and processes used in the construction of the propeller shall result in known and reproducible structural behaviour.				
Chapter 2	2.4 Pitch control and indication		Not Applicable		
Reference					
2.4.1	2.4.1 No loss of normal propeller pitch control shall cause a hazardous overspeeding under anticipated operating conditions.				
Standard

Annex Reference	AIRWORTHINESS OF AIRCRAFT  Standard or Recommended Practice	State Legislation, Regulation or Document Reference	Level of implementation of SARP's	Text of the difference to be notified to ICAO	Comments including the reason for the difference	
Chapter 2 Reference 2.4.2 Standard	2.4.2 No single failure or malfunction in the propeller control system during normal or emergency operation shall result in unintended travel of the propeller blades to a position below the in-flight low-pitch position. Failure of structural elements need not be considered if the occurrence of such a failure is shown to be extremely remote.		Not Applicable			
Chapter 3 Reference 3.1	CHAPTER 3. TESTS AND INSPECTIONS		Not Applicable			
Standard	Propeller assemblies with detachable blades shall be subjected to a centrifugal load with sufficient margin to ensure that the hub and blade retention system will operate satisfactorily and reliably under the expected loads in service under all anticipated operating conditions.

Chapter 3	3.2 Operational and endurance tests		Not Applicable		
Reference	•		Tr		
3.2	The propeller shall satisfactorily complete such tests as are necessary to ensure that it will operate satisfactorily and				
Standard	reliably within the declared ratings, conditions and limitations.  The tests shall include at least the following:				
	a) Function. Tests shall be conducted to demonstrate proper and reliable functioning of the pitch control system.				
	b) Endurance. Tests of sufficient duration shall be conducted at such powers, speeds and other operating conditions as are necessary to demonstrate reliability and durability of the propeller.				
	c) Operating environment. Except for fixed pitch wood propellers, it shall be demonstrated by tests or analysis based on tests or experience on similar designs, that the propeller is capable of withstanding the likely impact of a bird or a lightning strike without causing a hazardous propeller effect.
